Teaser	If you are planning a new mining project, in certain cases you must initiate a site-specific preliminary assessment to determine whether an environmental impact assessment must be carried out.
Volltext	If your company is active in mining and you are planning a new mining project, the competent authority may have to carry out a site-specific preliminary assessment. With this site-specific preliminary assessment, the authority determines whether an environmental impact assessment (EIA) is mandatory for your project. The site-specific preliminary assessment takes place in 2 stages: Stage 1:

## Modul

## Sachverhalt

- The authority checks whether there are special local conditions at your project site.
- If this is the case, stage 2 follows.

### Stage 2:

- The authority checks whether the new project may have significant adverse environmental impacts that affect the particular sensitivity or conservation objectives of the area.
  - Characteristics of the project
  - Location of the project
  - Type and characteristics of possible impacts.
- The authority bases its assessment on the following criteria:

In addition to the site-specific preliminary assessment, there is also a general preliminary assessment. You can find out which projects qualify for the site-specific preliminary assessment in the list "Projects subject to EIA" in Annex 1 of the Environmental Impact Assessment Act (UVPG).

During the preliminary assessment, the authority takes into account whether significant adverse environmental impacts are obviously excluded by the characteristics of the project, the site or your precautions. If the authority has the results of upstream environmental assessments or other legally required studies on the environmental impacts of the project, it will include these results in the preliminary assessment.

## Erforderliche Unterlagen

You must provide different information in stages 1 and 2 of the preliminary assessment.

- Information on special local conditions and relevant protection criteria
- In stage 1:
  - Information on the physical characteristics of the entire project and the demolition work,
  - Information on the location of the project and the ecological sensitivity of the areas, as well as on the protected assets that may be affected by the project.
    - the expected residues and emissions and, where applicable, the generation of waste
    - the use of natural resources, in particular land, soil, water, animals, plants and biodiversity.
  - Possible significant impacts of the project on the protected assets concerned as a result of
